To Pursue or Not to Pursue

Factors to consider

- **Benefit** to user – is the feature nice to have or does it truly improve the user experience? What is the value-add?
- **Risk** – what is the possibility of content or research being mis-represented or the feature running afoul of privacy guidelines and/or copyright?
- **Human involvement/effort** – is the solution trustworthy with minimal human involvement?

Facilitating discovery

Driving engagement

AI Capabilities: OUP's approach

- 
- **Move** fast but with control
 - Solutions for defined user problems
 - Working with partners to harness expertise
 - Limited to OUP-owned **and publishing partners'** content
 - Launch versions with development roadmap
 - Intensive user testing and live feedback

Oxford English Dictionary: AI Search Assistant

Who is it for?

- Anyone using OED to search for words

What problem does it solve?

- Need to quickly construct complex searches without having to navigate through OED's filters, taxonomies and information pages

How does it work?

- Users submit a query using natural language and receive a link to a pre-filled search result
- Cannot answer questions itself and cannot hallucinate

Oxford Academic: AI Discovery Assistant

Who is it for?

- Researchers who have access to one or more pieces of content

What problem does it solve?

- Need to get to relevant content quickly to streamline research process

How does it work?

- Supports natural language search queries across abstracts and metadata
- Generates a list of 5-10 highly relevant results accompanied by an AI-generated summary of each source

Oxford Law Pro: AI Research Assistant

**Oxford
Law Pro**

May 2025

Who is it for?

- Legal practitioners and academics who have a subscription to any part of Oxford Law Pro

What problem does it solve?

- Need for a streamlined and efficient way to conduct research combined with confidence in the integrity and trustworthiness of AI outputs

How does it work?

- Conversational search across full text content the user is entitled to
- Generates summarization of content and relevancy-ranked sources for further reading

Problems

Solutions

Researchers' **time** is at a premium; they want to get to content quickly and **don't want to be distracted by irrelevant content**.

Make searching for content **seamless**; return only the most **relevant** results.

Traditional search is run against **keywords** in text without any awareness of the wider context the user is interested in.

Use **AI** to process natural language queries, ensuring results are **context-aware**.

Users need **authoritative** content they can **trust** for their research and citations. Content must be attributed.

Build on OUP's existing trove of **trusted, vetted, authoritative content**, only returning results from OUP authors and partners.

Must-haves

**Manageable
number of
highly
relevant,
trusted and
vetted
results**

**Technology
stack
minimizes
environ-
mental
impact**

**Streamlined
chat
interface and
journey to
version of
record**

**Availability
indicators**

**Summary of
each result
so user has
context
before
clicking**

**Protections
in place for
IP and user
privacy**

**Clear
attribution**
